SCENARIO ANALYSIS · AKSHAYAAI RESEARCH

A Democratic Congress: what it means for markets and sectors

Scenario: Democrats control both the House and the Senate from January 3, 2027, while President Trump stays in the White House until January 2029. Prepared November 3, 2026 (election night); AI section updated November 5, 2026 with state election results and that day's market selloff. Market data as of the dates shown. Yellow highlights mark the points not to miss.

Source tags: **[Reported]** news reports or official data · **[Analyst view]** views of named outside analysts · **[AkshayaAI view]** AkshayaAI's scenario judgement, not a forecast · **[Calc]** our calculation.

KEY TAKEAWAYS

• **Divided government, not a policy U-turn:** a Democratic Congress cannot repeal the 2025 tax law, tariffs or executive actions on its own; President Trump keeps the veto, and Democrats lack two-thirds. The main change is that **nothing passes without both sides**, and Congress gains oversight, subpoena and Senate confirmation power **[AkshayaAI view]**.

• **The first market read was risk-off for AI, not a broad panic:** S&P 500 futures fell 1.2% and Nasdaq futures more than 2% as early results came in; the 10-year Treasury yield fell 6 basis points to 4.906% and the dollar index fell 0.37% to 101.34 **[Reported]**. Traders focused on tougher scrutiny of AI and data centers **[Analyst view]**.

• **AI and data centers are the biggest swing, but Congress cannot stop the buildout** (see section 1): permits, zoning and power hookups are state and local decisions, and federal agencies stay with the White House. What changes is that **the federal accelerator comes off** (override of state AI laws and data-center fast-track bills become unlikely), grid costs may shift onto data centers, and oversight rises **[AkshayaAI view]**. The real friction is local: only one in three Americans approve of the pace of data-center building (Reuters/Ipsos) **[Reported]**. Update, Nov 5: that local friction arrived at scale. Texas elected a governor promising a data-center moratorium, Ohio and Georgia governors-elect pledged pauses, opponents won nearly all of ~40 local ballot measures, and the Nasdaq fell into correction (section 1A). **[Reported]**

• **Healthcare is the first legislative fight:** Democrats say they will move right away to restore the Affordable Care Act (ACA) premium tax credits that expired in 2025 and to reverse Medicaid cuts in the 2025 tax law **[Reported]**. Hospitals and ACA-focused insurers stand to gain if any of it becomes law; Medicare Advantage insurers face more scrutiny **[AkshayaAI view]**.

• **Fiscal flashpoints move to 2027:** government funding runs only to December 11, 2026, and the $41.1T debt limit is expected to be reached between late winter and mid-summer 2027 **[Reported]**. Divided control historically raises shutdown and debt-limit brinkmanship risk **[AkshayaAI view]**.

• **History is supportive but not a forecast:** stocks have usually risen in the year after a midterm, and gridlock is often seen as market-friendly. But a Republican president with a Democratic Congress has historically been one of the weaker combinations, and today's macro backdrop (an Iran war, oil above $100, a Fed that hiked in September) can outweigh politics **[Analyst view]**.

1. AI and data centers: the key question for investors

Can a Democratic Congress slow AI or the data-center buildout?

Not directly. Congress cannot stop data centers from being built or AI models from being developed. Construction permits, zoning, water and power hookups are decided by states, cities and utility regulators; federal agencies, including the grid regulator FERC and the Commerce Department (chip export controls), stay under the White House; and any new law needs the President's signature, with no veto-proof majority expected. What changes is the direction of federal policy: the federal push to **speed up** the buildout loses momentum, grid costs may be shifted onto data centers, and oversight increases **[AkshayaAI view]**. The election-night selloff reflected sentiment and valuation more than any new federal barrier; the state results that followed are a more concrete brake (section 1A).

1A. Post-election update (Nov 5, 2026): the states moved

Section 1 argued that Congress cannot stop the buildout and that the real friction would be state and local. The results confirmed the channel, but at a larger scale than markets expected **[AkshayaAI view]**.

• **Texas flipped.** Democrat Gina Hinojosa defeated Gov. Greg Abbott. She promised "a moratorium — a ban — on all data center approvals" until the Legislature passes new laws, an end to data-center tax breaks, protection of water supplies, union labor requirements, and no higher electricity bills for Texans because of data centers. She takes office Jan 19, 2027, with a Democratic-led Texas House **[Reported]**. Texas is projected to hold nearly 30% of US data-center capacity by 2028 (Bloom Energy) **[Reported]**.

• **More governors with pause pledges:** Amy Acton (Ohio) proposed a conditional moratorium, lifted only if developers cover all utility costs, use union labor and meet environmental standards; Keisha Lance Bottoms (Georgia)

proposed a temporary statewide pause [Reported]. Data Center Watch found 43% of 74 governor candidates in 36 states backed a moratorium or ban [Reported].

• **Local votes:** opponents won nearly all of ~40 data-center measures in 10 states, including ~20 in Ohio and outright bans in Emporia, Kansas and (on preliminary results) Alhambra, California. In NBC's exit poll, 56% of voters called AI and data centers a major factor in their vote [Reported].

• Nuance the market may be overlooking: Texas was already slowing. Since August, Gov. Abbott has paused new data-center grid-connection approvals and environmental permits pending audits, and pushed for data centers to pay their own grid costs. The new governor's broader changes need the Legislature, so near-term change in Texas is smaller than the headlines imply [Reported] [AkshayaAI view].

Market reaction, Nov 5 (late morning, per the Associated Press) [Reported]

Market	Move	Read-through
S&P 500 / Nasdaq	–3.2% / about –5%	Nasdaq into correction, more than 10% below its Oct 6 record; worst S&P day since April 2025
AMD / Nvidia / Broadcom	–16% / –8% / –6%	AMD fell despite beating estimates (data-center revenue +97%): a constraint story, not a demand miss
CoreWeave / GE Vernova	–15% / –9%	GPU cloud and power equipment, the most build-dependent names
10-year Treasury / Brent oil	4.84% (from 4.90%) / ~$97	Some flight to safety; oil still high with the Iran conflict

Other pressures the same day: higher borrowing costs for data-center construction and the Bank of England's first rate hike in three years [Reported]. Moves were intraday and can change by the close.

Short-term correction or AI bear market? [AkshayaAI view]

Points to a correction	Points to a longer AI bear market
AI demand is still strong: AMD expects 2027 revenue to grow over 80%; Anthropic's Q3 revenue grew 1,127% [Reported]	Power and permits, not demand, may now be the binding constraint: chips can't be installed without sites, so orders could be deferred
New state rules take months and need legislatures; Abbott's pause already existed; building can shift to friendlier states	The backlash is broad (three large-state governors, ~40 local votes), not a Texas one-off
Scarce sites raise the value of capacity already built and connected	Higher financing costs hit a buildout funded heavily with debt and vendor financing
The Nasdaq corrected in March and July 2026 and recovered both times [Reported]	Stretched valuations; global rates rising (Bank of England hike)

AkshayaAI read: this looks like a repricing of a new constraint on AI infrastructure rather than an end to AI demand. It would turn into a broader AI bear market if hyperscalers cut capex guidance, chip orders are visibly deferred, or credit for data-center projects tightens. [AkshayaAI view] Not investment advice.

Who decides what: the levers over AI and data centers

Lever	Who controls it	Changes in this scenario?
Zoning, building and environmental permits for a data center	Cities, counties and states	No. Congress is not involved
Statewide pauses and ballot measures	Governors, legislatures, voters. New York paused permits for large data centers by executive order (Jul 14, 2026); on Nov 3 opponents won nearly all of ~40 local data-center measures in 10 states, and three governors-elect (Texas, Ohio, Georgia) pledged pauses [Reported]	No. This is where most real friction comes from
Electricity rates and who pays for grid upgrades	State utility commissions; FERC for interstate transmission (FERC has pressed grid operators in 2026 to rewrite large-load connection rules) [Reported]	Possibly. Congress could require large users to pay (see the GRID Savings Act below)
Federal permits and environmental reviews; federal land	Executive agencies	No. They stay with the administration
Overriding state AI laws	December 2025 executive order directs challenges to state AI laws; a lasting national override needs a law [Reported]	Yes: a federal override becomes unlikely, so state AI and data-center rules stand

Lever	Who controls it	Changes in this scenario?
Data-center permitting fast-track laws	Congress	Less likely; bipartisan permitting reform (including nuclear) remains possible (UBS) [Analyst view]
Frontier-AI safety rules	Congress for laws; agencies for guidance	Hearings likely; a law needs the President's signature [AkshayaAI view]
Chip export controls	Commerce Department (executive)	No. Congress can hold hearings only
Oversight and subpoenas	Congressional committees	Yes: new. AI safety, power bills, water use, Big Tech, chip exports
Confirmations (FERC, energy and other regulators)	Senate	Yes: new leverage over future appointees

What Congress can actually do

• **1. Take the federal accelerator off.** Probably the biggest effect. Bills that would override state AI laws or fast-track data-center permits become unlikely to pass. JPMorgan had said Republican control would be the "most supportive incremental federal policy backdrop for the AI/Infrastructure buildout" [Analyst view]. In this scenario the buildout loses an accelerator; it does not hit a brake.
• **2. Shift grid costs onto data centers.** Senator Martin Heinrich (D-NM), the top Democrat on the Senate Energy Committee and its likely chair in a Democratic Senate, introduced the GRID Savings Act (S. 5199) on Aug 3, 2026. It would make facilities drawing more than 150 MW pay for the grid upgrades their demand requires, require payment guarantees, and direct FERC to set a national large-load connection rule [Reported]. Provisions like this could ride on must-pass bills: they raise developers' costs; they don't stop projects. [AkshayaAI view]
• **3. Investigate.** Hearings and subpoenas on power and water use, AI safety and Big Tech. Raymond James's Ed Mills said probes could speed efforts to require safety standards for frontier models, independent evaluations, incident reporting and accountability for data-center developers [Analyst view].
• **4. Use the Senate's confirmation power** over future regulators, which shapes policy over years rather than months [AkshayaAI view].

Why AI stocks fell on election night

• **Valuations:** AI names had priced in an optimistic buildout, so any doubt moves them sharply [Analyst view].
• **Voter backlash as a signal:** power bills were a campaign issue; only one in three Americans approve of the pace of data-center building (Reuters/Ipsos) [Reported]. A strong Democratic showing, including the Texas Senate race, was read as a sign that local resistance could spread; Mirae Asset's Kim Seok-hwan warned projects "could face further delays" if Texas followed New York [Analyst view]. A Senate seat does not change Texas permitting law [AkshayaAI view].
• **The counterweight:** Societe Generale expected the AI trade to hold because Democrats are unlikely to reach a veto-proof majority and key agencies stay Republican-led [Analyst view]. Hyperscaler spending plans, not Congress, drive AI demand [AkshayaAI view].

Impact by part of the AI trade [AkshayaAI view]

Segment	Exposure in this scenario	Main channel
Data-center REITs and developers	Highest	State moratoria (Texas, Ohio, Georgia pledges), local bans, grid-cost charges, hearings on power and water
GPU cloud providers (neoclouds)	Highest	Growth depends on new sites and debt financing; first to feel permit delays
AI-linked utilities, power equipment and independent power producers	High	Who pays for new plants and transmission; state rate cases; fewer new connections
Memory, chips and chip equipment	Medium to high	Orders could be deferred if sites can't be built; export-control hearings; demand set by capex budgets
Hyperscalers and mega-cap platforms	Medium	Antitrust and AI-safety hearings; capex plans unchanged by law
AI model developers (private, pre-IPO)	Medium	Valuation sentiment; safety rules; IPO timing (below)
